---

In ourder to fix a problem I had with the latest version of vzctl I tried uninstalling it with rpm -e and then reinstalled an earlier version. When I start the VZ service it starts but it doesn't start the VEs. I can start them manually with vzctl start but I'd like to get them to start when I start the service.

What would rpm -e have erased that I need to put back?

Thanks in advance.
