Hi,

my Webserver is under DDoS Attack. It's a SYN Flood.
The Webserver is a VE with local ip address. The public ip is routed to the HN and port 80 of the public ip is redirected to port 80 at the local network ip (192.168.0.1).

Now i have to enable tcp_syncookies at the VE. But i seems that it is not possible. So what can i do to stop the SYN flood?

Any suggestions?

thank you!
