Hello,

I have OpenVZ installation on gentoo with latest kernel(2.6.32-budarin.1), and i have 2 vlans 30 and 31(default gateway on vlan 30) with different real ip subnets on them, then I create guest with real IP from vlan 31 i can't see it from outside the host.

The same configuration on CentOS with latest CentOS kernel was working fine.

Can you explain me why ?
