Hello,
I have a problem with my VPS.
Simple example:
```
<?php
$ip = $_SERVER['REMOTE_ADDR'];
Echo "User IP : " . $ip;

?>
```

That code should display the user IP address, but it's showing the HN IP address (not VPS IP address).

Again when I'm logging via ssh to the virtual container, the IP that was logged in is the Hardware nod's IP.

Here is the openVZ configuration:

```
# Kernel sysctl configuration file for Red Hat Linux
#
# For binary values, 0 is disabled, 1 is enabled.  See sysctl(8) and
# sysctl.conf(5) for more details.

# Controls IP packet forwarding
net.ipv4.ip_forward = 1
net.ipv6.conf.default.forwarding = 1
net.ipv6.conf.all.forwarding = 1

# Controls source route verification
net.ipv4.conf.all.rp_filter = 1

# Do not accept source routing
net.ipv4.conf.default.accept_source_route = 0

# Controls the System Request debugging functionality of the kernel
kernel.sysrq = 1

# Controls whether core dumps will append the PID to the core filename
# Useful for debugging multi-threaded applications
kernel.core_uses_pid = 1

# Controls the use of TCP syncookies
net.ipv4.tcp_syncookies = 1

# Controls the maximum size of a message, in bytes
```

kernel.msgmnb = 65536

# Controls the default maxmimum size of a mesage queue
kernel.msgmax = 65536

# Controls the maximum shared segment size, in bytes
kernel.shmmax = 68719476736

# Controls the maximum number of shared memory segments, in pages
kernel.shmall = 4294967296
# Disable proxy arp
net.ipv4.conf.default.proxy_arp = 0
# We do not want all our interfaces to send redirects
net.ipv4.conf.default.send_redirects = 1
net.ipv4.conf.all.send_redirects = 0
net.ipv4.ip_conntrack_max=32760

Can someone please help me ?

Thank you.

i create a php with that code, and i see my ip.

```
<?php
$ip = $_SERVER['REMOTE_ADDR'];
Echo "User IP : " . $ip;

?>
```

in this case:

User IP : 2001:666:c:abcd::2

in other pc:
User IP : 44.22.13.74
