
Subject: UUID inside VE

Hi,

OpenVZ VE root block device is /dev/simfs. Unfortunately I need to provide UUID of it for licensing purposes.

UUID is "connected" with udev which is not used inside OpenVZ VEs so this may be a problem. There is no /etc/blkid.tab either. I tried to create one manually just for test if blkid will read from it but it doesn't.

Is there any solution for this other than use KVM? Maybe some other location to manually enter the "fake" UUID?

Thanx,
Martin.

Hello,

Quote:

OpenVZ VE root block device is /dev/simfs. Unfortunately I need to provide UUID of it for licensing purposes.

sorry but I missed how exactly UUID is being checked?

Could you please explain in detail what kind of functionality must be supported inside a VE?

Is a system_call being called? Or a file inside /dev is being checked? Or an output of some file must obey a particular rule?

Is a system_call being called? Or a file inside /dev is being checked? Or an output of some file must obey a particular rule?

License generator is using system_call from within libuuid.so and libblkid.so

Details about the server:

I deployed one OpenVZ VE based on Centos 5.2-amd64 template and passed access to it to the company that installed the PACS system (for storing diagnostic image data). Few days ago I received a message from them, that their licensing mechanism is based on UUID of the root block device.

Kernel: 2.6.18-2-pve

HN: Proxmox 1.5 (debian based)

Is it possible to find out which system_call is called?

If there is an utility which fails the strace can be used.

But generally speaking, if some kernel functionality is used then it's impossible to workaround without modification of the kernel.
