Subject: TMPFS Limitations

Hi Guys,

I've VERY new to OpenVZ so forgive me if this is a silly post.

We want to run a container with a TMPFS mount with a size limit of say 200M. We need this 200M to be guaranteed available. So I did the following on the container as a test:

```
mkdir /mnt/test
mount -t tmpfs -o noexec,nosuid,size=200M tmpfs /mnt/test
dd if=/dev/zero of=/mnt/test/file bs=1M count=100
```

This should produce a file of 100M, but it stops at 88M and says "No space left on device"

This is the results of "free -m" on the container:

```
free -m
          total     used     free   shared   buffers   cached
Mem:       2048      134     1913        0        0        0
-/+ buffers/cache:    134     1913
Swap:         0        0        0
```

and this is "df -h" on the container:

```
Filesystem        Size  Used Avail Use% Mounted on
/dev/simfs        892G  4.5G 842G   1% /
none              1.0G  4.0K 1.0G   1% /dev
tmpfs             200M  85M  116M  43% /mnt/test
```

I've also adjusted the vmguarpages and privvmpages like this:

```
vzctl set vpsid --vmguarpages $((256 * 1024)) --save
vzctl set vpsid --privvmpages $((256 * 2048)) --save
```

Ideas?

To answer my own question, and perhaps anyone else who has been stuck with this (Doubtfull   )

You need to set shmpages (Still not a 100% sure what this is), like so:

vzctl set 1001 --shmpages unlimited --save

This will sort out the problem.
