Subject: NAT issue
Posted by aLittle on Fri, 10 Sep 2010 06:43:51 GMT

Hello,

I've a private setup of OpenVZ on CentOS. There are 5 containers in total, with significant amount of data being transferred between them. I was wondering if it is possible to assign each VPS a private IP along with the public IP it currently has.

I have seem multiple guides for using NAT on openvz containers. However, it appears they've been written(and probably tested) for systems with no unique public IP.

I know this would have been done by lots of OpenVZ fellows but can someone advise what can I do in this case?

For the curious, the site is a social networking site. The 3 VPS serve as web and database servers, while the remaining two are backup servers (We do off-site and offline backup from these vps).
