Hello,

Kernel: 2.6.18-194.8.1.el5.028stab070.5 64bit

Control Panel: SolusVM

I setup http://wiki.openvz.org/Setting_up_an_iptables_firewall

I am wondering how to setup multiple IP blocks. When I tried setting them up in the SEGMENT like follows

192.168.1.0/24 10.10.10.0/24 I received the following error

Firewall: Setting default policies to DROPBad argument `10.10.10.0/24'

Try `iptables -h' or 'iptables --help' for more information.

Just wondering I have several blocks of IP addresses assigned from the DC that runs on multiple servers.

try exec the script via

bash -x /etc/init.d/firewall start

and look up the command that produces this error.
