Hey!! i'm new (and noob too)

I have a question; maybe it's too easy for you::

I have a node (CentOS 64) wich is running openvz (obviously) and i've right now like 20 containers and using 20 ips..

Now i'll have to use only 5 ips and.. here is the problem!
I'm considering to use like 5 VE in the same ip, other 3 with other blah...

The thing is that all i found at the inet is about to use your node ip sharing with the VE using NAT, but i want to share between them...
I think it's the same but the configuration over a VE.. ¿is that right?

I think maybe it could add some latency and that's will be a problem because i'm hosting some FPS games wich that point is critical..

It would be better if i use dedicated VE to do the NAT job?? (i mean to create containers to make the redirection)

P.S. I've been using openvz for years but this is my first problem i can't solve, i would like to have any suggestion.
Sry for my english my greek & spanish are better
