Hi,

Within a VE the hplip setup script (<http://hplip.net/>) does not find my HP network printers (mdns/bonjour/slp). Even when specifying a printer by ip address it does not recognize it. I tried with venet and veth interface, but that does not make any difference.

I reports: "python: hp-setup[666]: error: No devices found on bus: net"

The same software on the HN does find it. I installed it as Ubuntu packages hplip & hplip-gui. I'm using Ubuntu 10.04 on HN (<https://help.ubuntu.com/community/OpenVZ#10.04>) & VE (default precreated template).

I have no idea what kind of special traffic it would use which apparantly is not available in the VE. Is there some --capability I could try?

Thanks for any suggestions.

Wessel
