Hello, was wondering if anyone else has seen this issue before. We currently monitor a number of OpenVZ containers with nagios and we frequently get ICMP warnings like "PING CRITICAL - Packet loss = 16%, RTA = 0.30 ms s" on these containers. Has any one else seen this and know what the cause and possible solution is?

Hi,

any ct failcnt monitorerd in ubc network parameters,
which type of networking is used - venet or veth ?

Bye,
Thorsten

Thanks for the reply, the VPS's use venet networking, not sure on the other question, where can you see if that is enabled?

Hello, the nodes use venet networking, not sure on the other setting though, where can check if that is enabled?
