I want my CT 103 to be on encrypted filesystem. I decided to use encfs. I mount encrypted directory using this command:
encfs --public /vz/private/.enc_raw /vz/private/enc
I've tried also FUSE options like: allow_root and allow_other. And I have symbolic link "/vz/private/103" -> /vz/private/enc/103.

[-]# ls -l /vz/private/
total 36
lrwxrwxrwx  1 root root    8 Nov 10 14:52 103 -> enc/103/

I start the container and I can enter it using "vzctl enter". It appears, that as root I can manipulate files. But when I do "su -l user" I can read and delete existing files, but can't create new files. And this causes that e.g. postgres can't work properly. The same problems occur when I do "chroot" to the encrypted file system. When I do "chroot /vz/private/enc/103" I receive:

bash: /dev/null: Permission denied
bash: /dev/null: Permission denied
bash: /dev/null: Permission denied
bash: /dev/null: Permission denied
bash: /dev/null: Permission denied
bash: /dev/null: Permission denied

And the same messages appear on every "su -l" or "su -l user". And the "user" also cannot create new files, but can read and delete existing ones.

What shall I do?

System Info:
[~]# lsb_release -a

Were you ever able to resolve this problem?

Try this page.  It has a section on "/dev/null" which looks promising.

I haven't tried it myself.

wiki.openvz.org/Physical_to_container

Try this. It has a section towards the bottom on "/dev/null" which looks promising.

I haven't tried it myself.

wiki.openvz.org/Physical_to_container

There is a section within the OpenVZ wiki, Physical_to_container, which describes how to turn a physical box into a container. There is a section that deals directly with how to handle "/dev/null" that I believe would be of use to you. Go to wiki . openvz . org / Physical_to_container (sorry, I'm too new to post links) to take a look.

Unfortunately it didn't help. Any ideas?
