
Subject: smbfs/ cifs inside VE

maybe I didn't look hard enough but I was unable to find any information why openVZ denies to mount a smbfs-share inside a VE.

I managed to setup the VE and even networking seems to work perfectly. I can ping, I can do name-resolving, but everytime I try to mount a smbfs inside the VE, I get:

```
dev128:~# mount -t cifs //192.168.1.30/test /mnt
```

```
Password:
```

```
mount error: cifs filesystem not supported by the system
```

```
Refer to the mount.cifs(8) manual page (e.g.man mount.cifs)
```

Note: the command works perfectly on the Hardwarenode (host-system)

My question is: is the error message correct? I am used to get false or misleading error messages from smbfs/ cifs.....

smbfs/cifs isn't virtualized now,
you can't use it inside VE.

All available in VE filesystems resides in /proc/filesystems
file inside VE.

You can do the following to make smb shares available in VE:

On HOST (!):

```
mount -t cifs //192.168.1.30/test /mn
```

```
mount --bind /mn /vz/root/101/mn
```

After that you can see contents of //192.168.1.30/test
inside VE in /mn directory.

You can automate this process using 101.mount and 101.umount
scripts in conf directory of OpenVZ.

HTH,
vass.

I have tried what you suggested but when I enter my VE the "bind" mount points still do not show content but the hardware host does have the mount information.

Can you, please, provide more information. Actually we need all actions you do: every command you type in bash and every answer you receive after it.

Thanks!

I was able to follow the instructions successfully. I can't seem to locate the mount/umount files in the conf directory (not entirely familiar with the file system layout) Can you please point me in the right direction?

I realize that 101.mount probably refers to [ve number].mount

On the host I did a umount for share that I did the mount --bind and was still able to access the files in the VE. I had to umount the directory in the VE from the host as well.

Another related question I have is (which may be off topic):

I wrote a quick bash script to backup some stuff to an external HDD. This drive may be off or not plugged in. Is there a way to test if the mount was successful before continuing? I guess I could just touch a file on the external HDD and test for that when running the backup. I was just looking for a more elegant and definitive solution.

Thanks!

Hello,

if you use vzctl from RPM, <veid>.mount and <veid>.umount files reside in /etc/vz/conf/ directory.
BTW, <veid>.umount scripts are not very necessary: everything will be umounted automatically on
VE stop. But you should mount with -n option in mount script then...

HTH,
Vasily
