Hi Everyone,

We have a openvz vps main node server running with more than 25 vps's on it. Presently we are facing serious issues as the server goes offline because of unknown reason . This only happens for a few seconds or a minute. But solusvm shows vps as offline. We cant ping,ssh to any vps even to the main node.

We have checked through each vps and nothing found as critical and flushed iptables as well. Our dc told there is no network issues from their end. Can someone have any idea how to fix this issue..??

There isn't any data we can look at to try and give any advice here... Isn't there anything in the logs on the hardware node? Which kernel are you running, etc.?
