Subject: Virtualmin Disk Quotas Reboot

Hi all, first post OpenVZ is great!

When I install virtualmin it set the diskquota for all users to 1GB. This worked, later I changed that for one user 5GB. This seemed to have worked as well - even after reboots of my container. But when the hosting company reboots the main node, the disk quota resets to 1GB. With webmin I can change it back to 5GB - until the next reboot?

Did anybody experience the same issue? How can I fix it? Probably I don't have any rights, but what could/should I tell the hosting company?

What puzzles me is that the 1GB quota that was set by virtualmin during installation actually survives the reboot. So it seems that Virtualmin was able to change the disk quota during installation.

Thanks for taking the time to read my post!
