## Subject: UBC excel sheet ?
Posted by normanu on Thu, 13 Jan 2011 09:37:21 GMT

Is there a excel sheet or so where u can fill in the min. ram and max ram and it calculates the kmemsize the dcache etc?

The standard templates light and basic are way to light and basic
I'm unable to run a lamp setup in basic even when I give it 1gb ram, I get applications seg faults and other strange errors.

Because (probably) the kmemsize didn't scale with, in the user_bean files this is the one which gives the failcnt's.

Anyhow is there someone who has a nice excelsheet like that ?

Another question is UBC with right settings able to mimic/do the same as SLM ?
