hello,

i wanted to pach connlimit into ovz kernel, so i did:

1: patched latest ovz patch on 2.6.18 kernel
2: patched latest patch-o-matic

everything went ok and no errors.

then i modifyed a config from ovz web site.

compiled kernel, got few errors but i fixed it and i got deb`s of my new kernel then installed it,
booted and so on.

my iptables was 1.4.2 and then i tried to use connlimit i have got:
iptables: Invalid argument error

in dmesg was:
ip_tables: connlimit match: invalid size 24 != 32 error

then i tried to update my iptables from netfilter web page

now my iptables is iptables v1.4.10 an again im trying to use connlimit and getting error:
iptables: Invalid argument. Run `dmesg' for more information.

dmesg - the same error.

Then I tried install only with ovz pach because i found connlimit in ovz cfg, but i got the same error

thnx for your time and answers.
