Have you looked at:

http://wiki.openvz.org/VEs_and_HNs_in_same_subnets

I confirm this is working no trouble..

Note:

If you have container dual stack (IPV4,IPV6)
but NOT all container on the IPV4 subnet,
you need to define a second bridge on
the host (with the IPV6 number) and container
with a second interface (eth1) attached to
the host second bridge.

Having the container set with one interface
carrying both IPV4+IPV6, but not all the container
on the same IPV4 subnet make the routing quite
unreliable.

Subject: memory usage

Hello,

Question

I have a big node running several containers

Below the memory usages

What is important for performance

The Physical memory usage (88%)

Or the kernel+ applications (28%)

Has someone a explanation how to read this ?

Memory Usage

Type	Percent	Capacity	Free	Used	Size
Physical Memory	88%	2.74 GB	20.96 GB	23.71 GB	
- Kernel + applications	28%		6.64 GB		
- Buffers	3%		837.63 MB		
- Cached	57%		13.51 GB		
Disk Swap	0%	3.99 GB	8.21 MB	4.00 GB	

Thanxs

Steffan

A few hints to consider:

Linux always try to use the whole RAM available, free RAM is useless after all. So nearly all RAM not used by applications/kernel/network buffers is used as filesystem cache as needed. In your case the most is in the fs-cache and Swap is not used at all, so you don't have a RAM shortage/performance problem related to RAM.

Regards

Andreas
