Hi,

I want some advice to the best way to configure my server:

i have 17 small vps with 256mb with very small usage and 1 vps running cpanel that i want to give most of resoucers.

my server: dual Intel Harpertown E5405 with 12gb ram.
kernel version: 2.6.18-194.26.1.el5.028stab081.1

i have solusvm installed and this server is for private use so i don't have problems with abusers.

My question is how to optimize resouces to run cpanel with best performance because i'm seen php scripts and mysql to run very slow inside the vps with cpanel.

solusvm (running php too) runs very very fast so i'm thinking thats the problem is because my vps to run cpanel is configured with small resources.

here the config for that vps:

guaratee ram: 4096

burst: 6144

CPU Units: 10000

cpu cores: 16

CPU %: 4400

io/priority: 5

some tip to fix this issue?

thanks,
stacker
