Hello,

it seems the some decencies are missing.
Is there some change in openvz setup procedure?

Loading mirror speeds from cached hostfile
 * base: mirrors.supportex.net
 * extras: mirrors.supportex.net
 * openvz-kernel-rhel5: openvz.proserve.nl
 * openvz-utils: openvz.proserve.nl
 * updates: mirrors.supportex.net
Setting up Install Process
No package vzpkg available.
No package vzyum available.
No package vzrpm43-python available.
No package vzrpm44-python available.

Those packages are obsoleted and were removed from /current recently. What installation instruction are you using?

Hi,

I just discover this topic and I think I have some related question, so here they are :

1) Does it means that the installation page "Install_OpenVZ_on_a_x86_64_system_Centos-Fedora" on the openvz wiki is also obsolete ?

2) Also I can see that there is no official i386 precreated template, is there a reason ?

3) I admit now that I was trying to do some centos 4 i386 templatecache (just because the system I want to virtualize are running on RHEL 4 i386). My HN is running centos 5 x86_64.
=> What would you suggest ? Using x86_64 precreated template instead ?

Thanks for your help,
