---

I have a dedicated server at a datacenter with an Intel i7 950 CPU, 8 GM DDR3 RAM, 1 TB SATA II HDD, 1 Gbps bandwidth, and 5 usable IPv4 addresses. I want to use OpenVZ to virtualize my system mainly because I use WHM/cPanel, which uses the entire system, and I don't want it to conflict with other things I do. I thought it would be best to put WHM/cPanel inside a VM on my server. I would also like to have another VM for game & voice servers as well as a BNC and VPN. I was planning to use Debian 6.0.1 64-bit as my host node with a cPanel VM, a VPN/BNC VM, and a game/voice server VM, but I don't know if it's just best to have a cPanel VM and put everything else on the host node or have another vm for everything else. Anyways, my plans right now are to have 1 VM for cPanel with 2 IPs and 1 VM for everything else. How does this sound? I was looking at veth/venet and wasn't sure which I should use either. Please advise!
