Hi all:

Can I have one VM using TCP/IP stack while another VM using, say, apple talk network stack within OpenVz?

I see on the OpenVz website saying the network stack is *isolated*, but the kernel is shared and the network stack resides in the kernel, is it possible for the above operation?? Thanks very much for your reply guys :P

Not sure if apple talk is supported by Openvz, but in theory it should work at least with virtual ethernet devices.

http://wiki.openvz.org/Virtual_Ethernet_device

Regards

Andreas
