
Subject: Multiple VE containers sharing disk IO on HW with multiple HDDs.

Hello,

I have OpenVZ node with multiple disks (12), node has multiple VE containers (30). Each HDD is shared between 2 - 4 VE.

It usually happens that 1 VE can utilise complete HDD and kill disk performances for other VE containers located on same HDD.

Is there any way to limit/share disk IO for machines located on same HDD, sharing disk IO between all machines per server is no good because of multiple HDD configuration.

Kind Regards,
VE4FUN

Hi,

maybe the ioprio option can help,
see man page, section "I/O priority management".

Bye,
Thorsten

Hello,

I know about wiki.openvz.org/Ioprio but I don't know how that can be from help when

for example:

HDD-1

VE: 101, 102, 103

HDD-2

VE: 104, 105, 106, 107

...

Now when VE 103 overuses HDD-1 only affected is HDD-1, Having global IO priority will mean that if HDD-2 containers are idle, HW will think that overall there is no disk over-usage, because total disk usage of HDD-1 + HDD-2 is nowhere near limits, but truth is something else, VE103 already reached HDD-1 disk IO limit and HW will do nothing to prevent it from doing that.

IO priority might work on single HDD but with multiple HDDs I doubt it serves the purpose.

Kind Regards,
VE4FUN
