Any users following here that have asterisk running under openvz?

Right now we have put a test box together to play with this, and we are struggling with dimensioning right now. Can anyone shed some light on parameters that worked for them, and any surrounding details, like how many extensions it handled etc.

If some of the bluewave guys could pipe in here that would be great as well.

Thanks

Miles

---

FreeSWITCH runs great under OpenVZ, I did it last week.

There's an article at openvz wiki:
http://wiki.openvz.org/Asterisk_in_VE_with_debian_stable

Perhaps it will help.

As my email said, I have it running and working for the most part, just need
some help tuning it out.

FreeSWITCH runs great under OpenVZ, I did it last week.

If you find a way to run sipXpbx without the whole Java-based GUI, it might be interesting. As it is, the memory requirements are just too high for more than just a few virtual servers.
