Freezer subsystem is used to manage batch jobs which can start stop at the same time. However, sometime it is desirable to let the kernel manage the freezer state automatically with a given duty ratio.

For example, if we want to reduce the time that background apps are allowed to run we can put them into a freezer subsystem and set the kernel to turn them THAWED/FROZEN at given duty ratio.

This patch introduces two file nodes under cgroup freezer.duty_ratio_pct and freezer.period_sec

Usage example: set period to be 5 seconds and frozen duty ratio 90%
[root@localhost aoa]# echo 90 > freezer.duty_ratio_pct
[root@localhost aoa]# echo 5000 > freezer.period_ms

In embedded systems, it is desirable to manage group of applications for power saving. E.g. tasks that are not in the foreground may be frozen and unfrozen periodically to save power without affecting user experience. In this case, user/management software can attach tasks into freezer cgroup then specify duty ratio and period that the managed tasks are allowed to run.

Usage example:
Assuming freezer cgroup is already mounted, application being managed are included the "tasks" file node of the given freezer cgroup.
To make the tasks frozen at 90% of the time every 5 seconds, do:
After that, the application in this freezer cgroup will only be allowed to run at the following pattern.

```
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>90% frozen</td>
<td>50% frozen</td>
</tr>
<tr>
<td>----------------------</td>
<td>----------------------</td>
</tr>
</tbody>
</table>
```
