I copied both .config-XXXXXX file from /boot to /lib/modules, under their corresponding directories. Then I came back to `dpkg -i` that kernel image, same error.

To compile the kernel, I downloaded "kernel-patch-openssl (028test007.1d2)" and "linux-source-2.6.18 (2.6.18-7)" from packages.debian.org. When I applied the patch, the error message is

```
../kernel-patches/all/apply/openssl
START applying openssl patch (OpenVZ kernel patch for virtual server support)
Testing whether "OpenVZ kernel patch for virtual server support" patch for 2.6.18 applies (dry
run):
1 out of 7 hunks FAILED -- saving rejects to file mm/fremap.c.rej
5 out of 44 hunks FAILED -- saving rejects to file mm/memory.c.rej
1 out of 6 hunks FAILED -- saving rejects to file mm/mprotect.c.rej
6 out of 29 hunks FAILED -- saving rejects to file net/ipv4/netfilter/ip_tables.c.rej
1 out of 8 hunks FAILED -- saving rejects to file net/ipv6/udp.c.rej
"OpenVZ kernel patch for virtual server support" patch for 2.6.18 does not apply cleanly
```

And according to this post : <http://www.mail-archive.com/debian-bugs-dist@lists.debian.org/msg295307.html>

patch 028test007.1 should apply against 2.6.18-8 or
patch 028test006.1 should apply against 2.6.18-7

But I only have patch 028test007.1 and kernel 2.6.18-7. I could download neither patch 028test006.1 nor kernel 2.6.18-8, from debian.org or kernel.org or openssl.org. What a dilemma.

Can you help me find the right kernel release or patch release, or kernel/ patch release that matches (release 2.6.x, x>=15 is ok, for SPARC64 of course) ?

Thanks

Sam
