hmmm... maybe the problem somehow is related to "I/O Acceleration"? is it possible to turn it off?

suggestions:

1. check mainstream 2.6.18 kernel with gentoo config.
2. check mainstream 2.6.18 kernel with openvz config.
3. if both (1) and (2) doesn't work - discard sysctl.conf changes for OpenVZ.
4. if (1) works, but (2) doesn't - problem in config.
5. if (1) works and (2) works - problem in OVZ patches.?
