Hello,

OpenVZ uses standard linux common capabilities security model. It is compiled in if CONFIG_SECURITY option is off. If CONFIG_SECURITY option is on, then user can use various security models. One of them: are selinux model and standard linux common capabilities security model. CONFIG_SECURITY_CAPABILITIES controls wether to build standard linux common capabilities security if CONFIG_SECURITY is on.

As OpenVZ supports only common capabilities security model, then CONFIG_SECURITY is off and CONFIG_SECURITY_CAPABILITIES is off too.

As concerns your problem. Please, read this thread

<http://forum.openvz.org/index.php?t=tree&th=791&mid=4203&&rev=&reveal=> I guess, it can help you.

Thanks,
Vasily
