Hi

I just tried to install OpenVZ on a Dell server (64bit) and got the following output

```
  Installing: ovzkernel-smp               ########################### [1/2]
WARNING: No module megaraid_sas found for kernel 2.6.9-023stab040.1-smp, continuing
anyway
WARNING: No module ata_piix found for kernel 2.6.9-023stab040.1-smp, continuing anyway
  Installing: ovzkernel-smp               ########################### [2/2]
WARNING: /lib/modules/2.6.9-023stab040.1-smp/kernel/arch/x86_64/oprofile/oprofile.ko needs
unknown symbol __down_read
WARNING: /lib/modules/2.6.9-023stab040.1-smp/kernel/arch/x86_64/oprofile/oprofile.ko needs
unknown symbol copy_from_user

unknown symbol strlen
WARNING: /lib/modules/2.6.9-023stab040.1-smp/kernel/arch/x86_64/kernel/microcode.ko needs
unknown symbol copy_from_user
WARNING: No module megaraid_sas found for kernel 2.6.9-023stab040.1-smp, continuing
anyway
WARNING: No module ata_piix found for kernel 2.6.9-023stab040.1-smp, continuing anyway
```

I rebooted to see if it would work, but it doesnt.

I saw someone else post this last year but it wasnt clear what the solution was - or if there is one.

Would installing 32bit Centos help or do I need to compile my kernel (shudder) as I have never done that before

Many thanks
