Okay, I now made a bridge, using the following commands:

```
brctl addbr vzbr0  
brctl addif vzbr0 veth61.0  
brctl addif vzbr0 eth0
```

But, now eth0 won't connect to anything. So I don't have an internet connection. After removing eth0, everything was correct again. If I try it with a Vlan instead of eth0, I don't have an internet connection in the VE.
