There are at least 2 options:

1. Most likely you run out of disk space in host system (i.e. on /vz). In this case `df -h` inside VE reports how much disk space is *really* available, independant of the fact that VE didn't used it. It is required for critical applications which use this statistics before doing something (e.g. rpm on package install/update).

2. you can try to remove /var/vzquota/quota.<VEID> file and restart VE. It will cause quota reinitialization.
