Goodmorning all,

I just did a fresh CentOS 4 install. As I did before, I wanted to install openvz on top of it. But.. appearantly kernel 2.6.18 has become the new stable branch. Thanks to that, openvz won't run on a freshly installed centos box:

[root@bassie vz]# yum install ovzkernel
Loading "protectbase" plugin
Setting up Install Process
Setting up repositories
Reading repository metadata in from local files
235 packages excluded due to repository protections
Parsing package install arguments
Resolving Dependencies
--> Populating transaction set with selected packages. Please wait.
---> Package ovzkernel.i686 0:2.6.18-8.el5.028stab023.1 set to be installed
--> Running transaction check
--> Processing Dependency: mkinitrd >= 4.2.21-1 for package: ovzkernel
--> Processing Dependency: initscripts >= 8.11.1-1 for package: ovzkernel
--> Finished Dependency Resolution
Error: Missing Dependency: mkinitrd >= 4.2.21-1 is needed by package ovzkernel
Error: Missing Dependency: initscripts >= 8.11.1-1 is needed by package ovzkernel

Any idea how to solve this? All packages are up-to-date and I loaded extras & plus repositories. Thanks!
