Hi,

This is our first experimental play with OpenVZ.

We have successfully installed and created a few VS's however when trying to install Plesk 7.5.4 we hit the following error which relates to the required rpm.

When executing rpm install command on the commandline we can clearly see the error as follows....

```
[root@vis100 FC3_std.updates]# rpm -Uhv perl-URI-1.30-4.noarch.rpm
Preparing...                ########################################### [100%]
   1:perl-URI               ########################################### [100%]
error: unpacking of archive failed: cpio: lsetfilecon failed - Bad file descriptor
```

Does anybody have any idea why this has happened?

Kind Reagrds

James Ormerod
