Hello!

We just tried to use the 2.6.20-ovz Kernel to fix the problem we described in http://forum.openvz.org/index.php?t=msg&goto=12444 .
Unfortunately we now really need features from 2.6.18 or higher because we need fuse support. Therefore we tried to use 2.6.20-ovz. But it always panics after about 5 minutes after start. Note: the hardware works fine with 2.6.9-ovz. This time it is another panic and has nothing to do with SATA problems. I've attached two screen shots to show you the panic. I really hope it helps you to fix that problem. Anyway I'll now try to use the RHEL5 kernel on CentOS 4.4. I hope this works fine.

Many thanks for your help and also thanks for your great project!

Bernhard
