New OpenVZ kernel is used getting an a boot error
 that hangs the boot of "Net:Registered protocol family 16" when
installed
on a CentOS version 4.4 server. Note this server had all updates
installed first prior to OpenVZ kernel install. Is this an issue or is
this a bug of some type as we found an updated tool "Error: 1ksctp_tools
conflicts with kernel >= 2.6.10" had to be removed to even load the
OpenVZ kernel download install at first . Considering reinstall of
CentOS with no updates if this is recommended for normal install of this
kernel? Any feedback appreciated as soon as possible.
