Can you check the value of `__NR_fairsched_chwt` in `vzctl`? It is defined in `include/vzsyscalls.h` depending on your architecture. For ppc it should be 402 (same as in kernel's `include/asm-powerpc/unistd.h`). In case these numbers are different things will go wrong.

You can easily check it the number using `strace`, like this:

```
# strace vzctl set 0 --cpuunits 1000 2>&1 | grep syscall
```
