Well, as I understand you just need a network interface inside VE which is separated from another VE. Right?

Then you just need to create a VE and assign an IP address to venet interface with help of following command:

```
vzctl set VEID --ipadd IP --save
```

And you don't need to create vlans at all. Two bonded interfaces will be in host system and you don't need to move them to VE.

Please correct me if I misunderstood your configuration and needs.
