I can not open /dev/tty0.
"DEVICES="c:4:all:rw" does not help.

/dev/tty works, but /dev/tty0 does not.
This is feature? or possible to solve this?
It is Okay to run Apache/Sendmail,
but a bit inconvienient for debugging or development or such purposes.

OpenVZ version: 2.6.18-028stab033

--- Okajima, Jun. Tokyo, Japan.

[If you dont add "DEVICES=c:4:all:rw" line to vps.conf]
cat /dev/tty0
cat: /dev/tty0: Permission denied
[If you add "DEVICES=" to vps.conf]
cat /dev/tty0
cat: /dev/tty0: No such device
(anyway, you can not access /dev/tty0. Why? This is inevitable feature?)
ls -la /dev/tty0
crw------- 1 root tty 4, 0 May 6 11:39 /dev/tty0
uname -r
2.6.18-028stab033
