Subject: *SOLVED* network performance

Hi,
I have three boxes running openvz on gentoo, and when trying to diagnose a problem with network performance to a seperate host not on my network, I found that the openvz boxes appear to get better performance than all other boxes I tested (to an order of perhaps 3x faster when wget'ing a file). This occurs both in the VE and on the host system.

The data file appears to be 50meg worth of A's so I guess is fairly compressable. What clever stuff is happening such that these boxes perform better? Kernel is 2.6.18-028stab031

Cheers,

john
