it looks like something goes really wrong on your server.

1. check disk space available in the system with ``df -h``
 2. looks like your defaults for inode diskquota in `/etc/vz/conf/vps-basic.sample` are wrong, since inode soft limit should always be smaller then hardlimit (it is stored in sample config as `DISKINODES="200000:220000"`, in your case it looks like it is `=2000000:220000`, which is wrong.
 3. check that VE template `/vz/template/cache/centos-4-i386-default.tar.gz` archive is not broken.
just unpack it somewhere with commands like:
`# tar vzxvf /vz/template/cache/centos-4-i386-default.tar.gz`
`# echo $?`
and check that no errors occurred. Maybe you have to redownload it from openvz.org
