Hi, Have been using openvz for a bout a year now with no problem. All of a sudden today. I started having errors with users connecting to a virtual node via ftp and uploading files. Users were unable to and were given an error local file processing. It turns out this this is the same for all the virtual servers. I thought it was diskspace but most were only at 50% the quota. When doing df command though all said they were at 100% used. A few reboots of the virtual host later and now when starting the virtual nodes, mysql will not run and I still cannot write files via ftp.

I can connect via ssh and copy files, i can also use wget and download files to these servers.

Any help greatly appreciated
