How to use this:

```
. mount -t container -ons_container ns_container /containers
```

```
. (unshare a namespace)
```

```
. cat /proc/self/containers
```

You'll see something like

```
ns_container:/node0
```

Unshare again, and you'll be in

```
ns_container:/node0/node1
```

thanks,

-serge
