Hi,

Eric Biederman has posted a few weeks ago a RFC-patchset concerning the network namespace.
I ported it to the 2.6.20 kernel and uploaded the patchset to

http://lxc.sourceforge.net/network.php

For the part I had to used (TCP/UDP-IPV4 with usual ethernet device), I found the patchset pretty stable.

You can find in the website:

- a global description of what is the network namespace
- a howto for the network namespace configuration
- a benchmarking matrix
- the network namespace patchset for 2.6.20 kernel

I hope that can helps to answer what is ? , what for ?, how to use ? questions.

If you have any questions or feedbacks, feel free to send an email to containers@ mailing list

Thanks.
