no one is against generic code and ability to create 2 interfaces in **one** namespace.
(Like we currently allow to do so in OpenVZ)

However, believe me, moving an interface is a **hard** operation. Much harder then netdev register from the scratch.

Because it requires to take into account many things like:

- packets in flight which requires synchronize and is slow on big machines
- asynchronous sysfs entries registration/deregistration from
 rtn_unlock -> netdev_run_todo
- name/ifindex collisions
- shutdown/cleanup of addresses/routes/qdisc and other similar stuff

Thanks,
Kirill
