Specifying something like `routes_venet0=("default via 191.255.255.1 dev venet0")` was never supported. It will break when `iproute2` is installed and it will break with `baselayout-1.12.*`. The device name is given in the variable name. It's just a bug in `baselayout-1.11`'s `ifconfig` support module that the device name isn't passed to the `route` command automatically.
