Hi,

How can I reaset the failcount in /dev/user_beancounters ?
In previous cases I just restarted the hardware node to be sure that everything is is a defined state.
Because this time I have to do this on a production system I don't want to reboot the hardware node. I hope there is a another way to do this without even restarting any of the VPSs. If so, please explain it to me (or just say it is described in document X).

Bernhard
