Subject: Physical server to OpenVZ

Hi List

I am brand new to OpenVZ. I will get straight to the point.

I want to backup physical servers on remote sites with tar/dump and restore them at our central office to virtual machine. Once disaster strikes move the virtual server to a new physical server and transport it to the remote office.

My question:

1) Is this possible (backup physical server and restore to virtual) ?
2) If so is there any documentation / HOWTO's or pointers that you could give please ?

Thanks in advance.

Regards
Stefan.
