Badari,

We account for page cache usage as well now, I suspect you most likely have page/swap cache pages charged to the container.

You can try several options (some documented in Documentation/controllers/memory.txt)

1. Try executing `sync; echo 1 > /proc/sys/vm/drop_caches` and then remove the directory
2. Prior to assigning tasks, set `memory.control_type` to 1, that tracks only RSS pages. You'll find `memory.usage_in_bytes` go to zero as soon as all the tasks exit
3. Set `notify_on_release` and use the `release_agent` and `releasable` to free the container once all pages charged to it are freed.

I wonder if I should provide a `force_reclaim` (hard to guarantee it will work) for each container, so that the container can be freed.
