Hi,

I have joint devel list recently. I want to contribute to OpenVZ. I have read few papers on openVZ and one of the papers "Performance Evaluation of Virtualization Technologies for Server Consolidation" (HP Labs) - says that , "For OpenVZ, there is no existing tool to directly measure the CPU consumption by a particular container. We use the data provided from /proc/vz/vestat to measure the amount of CPU time spent by a particular VE." also on wiki - roadmap one topic suggested is "fix broken loadavg/cpu usage statistics" - According to my understanding both refers to same. But when I used top in VPSs, it worked and gave CPU usage statistics for particular VPS. So I doubt the problem is already solved?

Can anybody guide me that is this problem solved? If No, can somebody elaborate this problem?

It that problem is already solved, please suggest me some small staring task.

Thanks in advance,

Khyati Sanghvi
