The __u16 queue_mapping field only makes sense in the CONFIG_NETDEVICES_MULTIQUEUE=y case only.

Despite this field may be set explicitly to some non-zero value (in net/core/pktgen.c), the exact value affects nothing in case the config option in question is N (mainly it is used in netif_subqueue_stopped(), which will always return 0 in this case).

So cleanup the code a bit and move this field under the config option.
